« Like pipes in a wall crucial to having running water in a home, the informational infrastructure was nearly invisible. Use of information proved so routine, indeed mundane, that like using a faucet or bathroom fixtures, people did not think about it, because it was always present. It is information’s pervasive, embedded nature that perhaps accounts for why we [...] have not paid much attention to it. But now we should, because as happens, once a phenomenon is named or is made obvious, it becomes easier to optimize its use. »¹

In his book on the history of information in the United States, James W. Cortada argues for the need to understand evolving characteristics of information ecosystems. Cortada defines these ecosystems as facilitators of three activities of our contemporary societies: ‘appreciating what needs to be understood, seeing how this understanding should be developed, and seeing how it could be used’².

Since World War II, the amount of information stored and processed in organisations has grown exponentially, giving rise to a new category of ‘knowledge workers’ performing in horizontal information structures³. Based on the assumption that each firm and each industry develop idiosyncratic knowledge, organisation and strategy scholars of the 1970s introduced information as a fourth factor of production. Then, in the 1980s, the information ‘revolution’ shook up traditional industrial structures with changes in competitive rules and the introduction of new forms of competitive advantage⁴.

Since then, the use of information with respect to accounting, finance, personnel, prices, logistics or customers significantly expanded, especially with the increasing computerisation that helped people to better store, process and share information to improve strategic decisions⁵. These recent changes have led to new forms of science that became necessary to support professional managers’ decisions and to develop new knowledge-based approaches.

The 24th Colloquium in the History of Management and Organizations aims to generate a historical perspective to our understanding of the use of these different forms of information in organizations. Papers aligned with four sub-themes are particularly welcomed:

- **The evolution of the use of information for organisations**: While accounting information is often considered as one of the first languages in organisations, other accounts (relative to finance, personnel, price, logistics and customers) appeared relevant to store with the aim to assist decisions and strategic choices made by firms. What have these evolutions been? For which types of information? And for what aim?

- **The history of scientific knowledge and its diffusion in management and organisation studies**: The rise of information in organisations has coincided with the professionalization of managers who express the need to formalise and transfer their managerial knowledge. The diffusion of knowledge in accounting, finance, marketing, human resources management, logistics or strategy has attracted the attention of scholars. What trajectories have taken these diffusions? For which type of knowledge? In which institutional contexts?

- **The account of information as an intangible asset in organisations**: given the immaterial nature of information and tacit knowledge, the challenge to transform this asset in value creation has long questioned scholars. Currently, the idea to re-materialise or to make more visible these information infrastructures has led to new issues and to new research avenues aligned with sociological oriented approaches dealing with materiality in organisations. Concerns related to security and standardization could also be considered.

- **Digital transformation and new forms of value for information**: Considered by some scholars as a fourth industrial revolution, current digital transformation is seen as a phenomenon based on unprecedented technological changes such as artificial intelligence, virtual reality and the Internet of Things. The consequences of these technological innovations, despite being very uncertain regarding their social impacts, put the user at the heart of innovation processes providing value to personal data and disrupting traditional business models. To what extent are these current transformations part of a longer history of computer science and of management information systems?

These sub-themes are non-exhaustive and given the main theme of the colloquium, pluridisciplinary research is particularly encouraged (within management studies or with other sciences such as computer science, law, sociology, economics, psychology, etc.).

---

Keynote Speaker: James W. Cortada is a business historian and Senior Research Fellow at the University of Minnesota. Dr. Cortada spent nearly 40 years working at IBM in sales, consulting, management and executive positions. He is the author of both ICT management books and business history. He is the author of All the Facts: A History of Information in the United States Since 1870 (2016) and IBM: The Rise and Fall and Reinvention of a Global Icon (2019).

Doctoral workshop
The Colloquium will start with a doctoral workshop organised on 27 March at EDHEC Business School. Ph.D. students who seek to present their work should send a ten-page document presenting research area (theme, research questions), theoretical framework, methodology, first results and main bibliographical references. First- or second-year Ph.D. students or Ph.D. students incorporating a historical dimension in their dissertation in management are strongly encouraged to apply.

Important deadlines
- Submission of Papers: Short papers (3000 words) written either in English or French should be submitted no later than 14 December 2018. Full texts will be accepted.
- Notification of Acceptance: Notification of papers accepted for inclusion in the conference program will be made by 25 January 2019.
- Final version of papers (30,000 in 50,000 signs): 22 February 2019. Final papers should be written either in English or French with summaries in French and English.

Scientific Committee
Lise Arena, Université Côte d’Azur
Régis Boulat, Université de Haute-Alsace
Ludovic Cailluet, EDHEC Business School
Muriel Dalpont-Legrand, Université Côte d’Azur
Mathieu Floquet, Université de Lorraine
Patrick Fridenson, EHESS
Gérald Gaglio, Université Côte d’Azur
Eric Godelier, Ecole Polytechnique
Hélène Gorge, Université Lille 2-Skema Business School
Nicolas Guilhot, Université Lyon 3, IFRoss
Pierre Labardin, Université Paris-Dauphine
Eve Lamendour, Université de La Rochelle
Cheryl McWatters, University of Ottawa
Nathalie Oriol, Université Côte d’Azur
Paulette Robic, Université de Nantes
Béatrice Touchelay, Université Lille
Philippe Véry, EDHEC Business School
Elisabeth Walliser, Université Côte d’Azur

Organising Committee
Lise Arena, Université Côte d’Azur
Ludovic Cailluet, EDHEC Business School
Savéria Cecchi, Université Côte d’Azur
Nathalie Oriol, Université Côte d’Azur
Philippe Véry, EDHEC Business School

Proposals should include:
- A research question;
- A fieldwork / primary sources or a corpus
Proposals should be sent to: jhmo2019@gmail.com
